KPDES FORM HQAA

Kentucky Pollutant Discharge Elimination System (KPDES)

High Quality Water Alternative Analysis

The Antidegradation Implementation Procedures outlined in 401 KAR 5:030, Section 1(3)(b)5 allows an applicant who does not accept the effluent limitations required by subparagraphs 2 and 3 of 5:030, Section 1(2)(b) to demonstrate to the satisfaction of the Environmental and Public Protection Cabinet that no technologically or economically feasible alternatives exist and that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the water is located. The approval of a POTW's regional facility plan pursuant to 401 KRS 5:006 shall demonstrate compliance with the alternatives analysis and socioeconomic demonstration for a regional facility. This demonstration shall also include this completed form and copies of any engineering reports, economic feasibility studies, or other supporting documentation

form and copies of any engineering reports, economic feasibility studies, or other supporting documentation

II. Alternati	ves An	alysis				
II. Alternatives Analysis 1. Has discharge to other treatment works been investigated? (If yes, then indicate which treatment works were considered and the reasons why that discharge to these works is not feasible.) Alternative treatment works has been investigated. The nearest water treatment system is the Whitesburg Water Treatment system approximately 20 miles away. It would cost approximately \$1,608,000.00 (105,600 feet of pipe and pumps) to collect and gather the discharge. This is composed of \$15.00 per foot and \$24,000.00 for pump station. It would cost another \$2,112,000.00 to send the discharge to the Whitesburg Treatment Plant. The Whitesburg treatment plant would require a sedimentation basin to remove the silt before allowing it to enter the plant. These costs prohibit this alternative. Another option for transport would involve the use of self-contained disposal trucks which would also be excessively expensive. With this said it would take approximately 12 self-contained disposal truck would also be excessively expensive. The dollar amount for said disposal trucks to remove 12 loads of sediment per day would be approximately \$36,675.00. Due to the topography of the area, several pump stations would also have to be constructed and bring these costs up even more. Discharges will be the result of stormwater and drainage from the mine site. The storm water will be

DEP Form -1 - Revised November 16, 2004

II. Alternatives Analysis - continued		
 Has water reuse or recycle been investigated as an alterative to discharge? (If yes, then provide the reasons why it is not a feasible alternative The water conservation includes hydro-seeding and dust-control. Water used for dust suppression in a day 	Yes would be	No
15,000 gallons. This would be approximately 10% of the storm water of this permit area. The remaining 100 storm water would have to be pumped to a treatment plant. Dust suppression is only required during dry flow of discharges is low or non existent. The cost to collect this amount of flow prohibits the use of all the The cost to collect this water has been estimated at \$1,608,000.00. Therefore, water reuse or recycle is alternative. Also, There are no other facilities on site (preparation plant) that will require a raw wat drainways of all the ponds collectively is 53.9 acres, which would produce more storm water than could be The site would generally be able to use approximately 15,000 gallons a day during the rainy season.	times wh flow gene not a fe er source	erated. easible e. The
4. Have alternative process or treatment options been evaluated? (If yes, then indicate what process or treatment options have been evaluated and provide the reasons they were not feasible.) The discharges will be the result of storm water and drainage of the watershed as well as release of water from the dugouts, which are used in this project for sediment and drainage control. There will be no hydrological controlled discharge. The discharge will be less than 1/10 c.f.s. of the stream. As an alternative treatment option, a wastewater treatment plant was evaluated but deemed not applicable. The cost of a wastewater plant would be \$750,000.00 and an additional \$150,000.00 for pumping and or other water to gather the discharge to it. A major feat included is also getting the discharge to one plant due to the typography in the area. It is also normally designed for smaller drainage areas. Construction of other mines of sediment control facilities do not meet the Regulations as stated in 405 KAR 16:070 and are inadequate to handle this amount of flow.	Yes	<u>No</u>
If a plant was constructed and utilized for some of the storm water, there would be no need or future use of such site after mining. Prior to bond release the site would have to be dismantled and the site restored to pre-mining conditions. This would cost approximately 1,200 man hours at \$20.00 and hour being \$24,000.00.		
This is a proposed coal refuse recovery area with associated facilities which will entail 10.3 surface acres. This includes an existing road, a topsoil storage area, an excavated sediment basin, and an existing refuse fill to be reprocessed. By the continuing mining operation such services as engineering, mine supplies, and training will be needed for the mining industry. Then this continuing operation will avoid the decrease of the area employment.		
This area is also in the southeastern portion of Kentucky in Letcher County. Mining jobs are few and this operator will provide opportunities for these type jobs to continue in the workforce. Without this operation, these jobs would have to be moved or lost to another area. This job will mine approximately 100,000 tons generally about \$35,000.00 in severance tax of which Letcher County will directly receive around 15%. The mining proposed not only provides new and increased economic service to the community, but prevents the loss of those benefits.		
If other means of wastewater treatment was constructed on site the short lived need of storm water treatment would exceed the plants life expectancy. There would be no other use of such facility in the immediate area. It would not be cost effective to pump area wastewater up hill to the facility. Therefore the site would only have to be dismantled and sold for scrap metal.		

II.	Alternatives Analysis - continued		
Onsir septical larger only event each per a waste would inade structure would would this place accurate m	Have on-site or subsurface disposal options been evaluated? If yes, then indicate the reasons they were not feasible.) te and subsurface disposal options are not feasible alternatives. The installation of a sanitary c system, i.e., septic tank was evaluated but is not an applicable option. Building a system e enough to handle the volume of water would be impractical. The typical septic tank will hold back 1,000 gallons. This job could produce up to 115,000 gallons a day during a storm t. With this anticipation, it would require 115 septic systems with drain fields up to an acre for each event. This site will not have adequate useable space that this number (115 systems a day storm) of systems could be placed. Septic systems are designed to degrade organic e and biodegradable material over time by anaerobic digestion. While the source water d most likely contribute some organic material and some needed bacteria, this would be equate to decompose the sediment and would work essentially the same as a sediment enture. Also, the possibility of drilling an injection well (to inject the discharges underground) anding on depth could cost up to \$50,000.00 per well. At a value of 10,000 gallons a day it d take at least 12 wells to dispose the storm water. Injecting these discharges underground d also increase the potential of an outcrop blowout or blow out from an old adit. Injecting water underground would also require a UIC Permit. There hasn't been found a suitable to inject within a reasonable distance of this site. The storm water and drainage will mulate over time so that on-site or subsurface disposal will not be adequate over the long. The storm water must be discharged from the project site.	Yes	No
The s so that from const create to be water per p Hemp and emple the to the lo	Have any other alternatives to lowering water quality been evaluated? If yes, then describe those alternatives evaluated and provide the reasons why these alternatives were not feasible.) storm water will be maintained in a dugout/pond prior to discharge. This will allow settling to occur at lowering of water quality will be minimized based on applicable regulations concerning discharges the project site. It is not feasible to store the water on-site, dispose of it below the surface, or ruct a treatment facility for a short-term project. Accepting lower water quality standards would be additional burden and cost to this project. In order to lower the standards larger ponds would have built. For the embankment ponds this means more disturbances in the streams, larger volumes of r stored behind the embankments, and higher construction/removal costs (approximately \$ 15,000.00 ond. Avoiding this project is not a viable option as the advantages to the economic development of the phill area of Letcher County would not be realized. Jobs would be lost, the tax base would diminish, local business would not prosper. In Letcher County, mining jobs consists of 11.5% of total county wages. The 30 jobs lost would be approximately 3% of total work force in the mining industry in Letcher County. Therefore, if this job does not materialize loss of 30 jobs would drive the economy down by \$1,166,880.00 by loss of revenue. The acceptance of stringent discharge limitations is not cost effective or practical in these mining applications.	Yes ⊠	No

III. Socioeconomic Demonstration

1. State the positive and beneficial effects of this facility on the existing environment or a public health problem.

Following the conclusion of mining, the area will be reclaimed, which will provide an enhanced habitat and environment. Once mitigation begins, the stream banks will be stabilized to prevent erosion, species indigenous to the area will be planted to establish an adequate riparian zone and stream channels will be rehabilitated to curb sedimentation. This will provide a healthier habitat for aquatic species and wildlife leading to a more balanced ecosystem. Additionally, recovery of the coal will increase severance tax revenues, which will be returned to the community. This money can be used for environmental protection such as sewage disposal, sanitation, and solid waste disposal, which will have beneficial effects on the existing environment. This area has been previously mined and logged. These areas will be re-established for regarding and revegetation in the mining areas.

2. Describe this facility's effect on the employment of the area

This mining operation will increase the amount of employment in the area for approximately 10 workers and provide higher paying jobs than other industries in the county. This will aide in bringing unemployment rates closer to the state and national averages. Mining pays an average weekly wage of \$748.00 in Letcher County compared to an average industry weekly wage of \$547.27 (U.S. Bureau of Labor Statistics). The majority of these jobs provided for local residents of Hemphill. This will also create or sustain approximately 20 workers indirectly.

3. Describe how this facility will increase or avoid the decrease of area employment.

This facility will avoid a decrease in the area's employment by providing jobs at a new mine, which will replace jobs at an existing facility upon closure. The operation of the facility will increase the area's employment by requiring services such as equipment sales and repair, engineering services, fuel, transportation, etc. It is likely that a new mine will lead to an increase in employment, but at the very least, by maintaining existing jobs, this facility will avoid decreasing the area's employment. A decrease in mining activities in the area would produce the detrimental effect of more unemployed residents, leading the area to economic distress. Therefore, this operation will provide for the continuation for the employment of the work force in place. All jobs associated with this operation will be permanent for the life of the mining operations. The affected 30 jobs are approximately 3% of all mining in Letcher County. This job will directly employee 10 workers and 20 jobs indirectly within an average salary of \$38,896.00.

4. Describe the industrial or commercial benefits to the community, including the creation of jobs, the raising of additional revenues, the creation of new or additional tax bases.

This mine facility has provided jobs to the Letcher County, particularly the Hemphill area. Without the additional mining area those jobs will be lost or moved to another area. The mine will provide new jobs or prevent the loss of jobs when an existing facility closes. This job is anticipated to produce 100,000 tons of coal. This will average \$35,000.00 in coal severance tax revenue. Recovery of the coal located along Hemphill will require payment of severance taxes (approximately 15%) being \$5,250.00, which should be returned to Letcher County to provide funds to establish alternative industries, as well as provide for public safety, environmental protection, public transportation, vocational training, health/recreational facilities, social services, industrial/economic development, workforce training, and secondary wood industry. In the past Letcher County has also used those tax dollars to improve or maintain law enforcement, fire protection, ambulance service, libraries and educational facilities, and public parks. The affected 30 jobs is approximately 3% of all mining jobs in Letcher County. This job will directly employee 10 workers and indirectly 20 jobs with an average salary of \$38,896.00. This is a total of \$1,166,880.00 loss to the local economy of the Hemphill area of Letcher County.

Property values increase when land is active. Therefore, when mining is being conducted, the land has an increased value which requires increased property taxes be paid.

5. Describe any other economic or social benefits to the community.

The facility will require supporting jobs as well as mining jobs. Equipment sales and repair, mining/engineering consultants, and fuel/transportation providers will be needed as a result of the mine. The continuation of these jobs and the taxes collected because of it spurs community development and the creation of more jobs in the Hemphill and other surrounding communities in Letcher County. It also provides additional revenue to the businesses of the area already in existence, which creates more jobs and development. The increased payments of property taxes will benefit schools so that they have better equipment and facilities and better paid teachers. Also, the increased tax payments will provide additional money for government services to better serve the citizens. After mining is completed the area will be utilized for many outdoor recreation activities. The additional mining should increase the coal severance tax. This will add an annual basis to the Letcher County tax base.

DEP Form - 4 - Revised November 16, 2004

Ш	. Socioeconomic Demonstration - continued		
		Yes	<u>No</u>
6.	Will this project be likely to change medium household income in the county?	\boxtimes	
7.	Will this project likely change the market value of taxable property in the county?	\boxtimes	
8.	Will this project increase or decrease revenues in the county?	\boxtimes	
9.	Will any public buildings be affected by this system?		\boxtimes
	How many households will be impacted by this project? How will those households be impacted? Letcher County, as a whole, will be impacted by the increased revenues this mine will provide to the existing business, particularly around Hemphill. The employees will be impacted positively with a more secure place of employment and higher than average income. These earnings will help these households to maintain or enhance their current economic status. This operation will directly employ approximately 10 full time employees. These will come from the Hemphill area. By this operation being a new job in the area. This provides opportunity for these positions that were previously unemployed by other jobs ending in the coal industry or else where. Also another 20 households will be maintained or supported from this mining operation in the immediate area surrounding Hemphill. This brings much more purchasing power for the Hemphill area in Letcher County. With the additional income of this mining operation and the tax revenues it generates, additional educational opportunities will be enhanced and/or created. With the full time employment benefits, medical care insurance will be provided to assist the workers and their families adequate health care. Also the coal severance tax revenues will provide more community services for the elderly and better police and fire protection in the area. The average mining job in Letcher County brings \$748.00 per week with an annual average income of \$38,896.00. This compares to an average salary in Letcher County as \$547.27 per		
	week with annual income of \$28,458.00. The average \$10,438.00 extra income will generate \$313,140.00 more revenue for Letcher County per year.		
12.	Does this project replace any other methods of sewage treatment to existing facilities? (if so describe how) The project is not a sewage treatment facility. There are no existing sewage waste water discharges that this project could replace.	Yes	No
cha	Does this project treat any existing sources of pollution more effectively? (If so describe how.) Sediment control from prior mining will be improved. Existing growth will be removed and annelization of receiving stream due to excessive silting will be improved. Prior to the state of s project, the mine site will be cleaned and all garbage material will be disposed of.	Yes	No 🔀

DEP Form - 5 - Revised November 16, 2004

III	I. Socioeconomic Demonstration - continued		
14.	Does this project eliminate any other sources of discharge or pollutants? (If so describe how.) This site will provide better sediment control from run-off resulting from gas wells and logging in the permit area. After reclamation the drainway patterns will be established and sediment ponds/treatment will be removed and discontinued. The areas will be better established in grading and revegetated. Trees will also be planted to better the viewsheds of the area.	Yes	<u>No</u> ⊠
15.	How will the increase in production levels positively affect the socioeconomic condition of the area? The increase in production levels will be the result of mining in the watershed. This operation proposes to mine approximately 100,000 tons of low sulfur coal much needed to continue the electrical generation of our area. This generates high paying jobs, generates coal severance tax, and additional employment opportunities in the Hemphill area. Therefore, the project will provide jobs or maintain the current level of jobs in the area, increase tax revenues to pay for a variety of services, and provide other jobs such as engineering services and fuel/transportation providers. This will create additional revenue for the existing businesses of Hemphill and surrounding areas in Letcher County. These additional revenues can provide increased benefits in public safety (law enforcement, fire protection, ambulance services) and aid in the industrial and economic development of the area.		
16.	How will the increase in operational efficiency positively affect the socioeconomic condition of the area? The increase in operational efficiency will in turn increase the production levels leading to increased employment opportunities in the area, maintenance of existing employment, development and maintenance of indirect jobs and increase in the amount of personal and severance tax the area receives. The proposed mining operation is to eliminate the highwalls, re-establish vegetation with trees and create a diverse habitat for wildlife. Thus eliminating the existing environmentally damaged areas and creating and enhancing the viewsheds. The operation will also provide much needed coal to help in our nation's energy crisis.
